

## The ENVIROSCAPE Model :

This program educates the audience about watersheds. The model of a watershed visually explains point and non-point source pollution. Students get a hands on demonstration of the effects of water run-off, the pollutants that get carried away, where it all ends up, and what conservation practices can be done to improve the watershed. This model can be used to cover a variety of environmental topics. (Grades 3 & up, 45 minutes min. to over an hour).

Mississippi River Basin
